## The Deduction System of Matching Logic

Formal Systems Laboratory<sup>1</sup>

<sup>1</sup>University of Illinois, Urbana-Champaign, USA

May 7, 2017

### Abstract

This paper proposes a sound and complete deductive system of matching logic, proves dozens of useful metatheorems about the deductive system, and shows its applications in (1) modeling transition systems; (2) symbolic executions; and (3) reasoning with contexts.

## 1 Syntax

Formulas of matching logic, called *patterns*, are written in a formal language, denoted as  $\mathcal{L}$ , whose grammar is listed in (1). The language  $\mathcal{L}$  is many-sorted. A signature of  $\mathcal{L}$  contains not only a finite set  $\Sigma$  of *symbols*, but also a finite nonempty set  $S$  of *sorts*. Each symbol  $\sigma \in \Sigma$  is, of course, sorted, with a fixed nonempty arity. We write  $\sigma \in \Sigma_{s_1, \dots, s_n, s}$  to emphasize that  $\sigma$  takes  $n$  arguments (with argument sorts  $s_1, \dots, s_n$ ) and returns a pattern in sort  $s$ , but we hope in most cases sorting is clear from context.

The grammar for  $\mathcal{L}$ , as defined below, is almost identical to first-order logic, except that in  $\mathcal{L}$  there is no difference between relational (predicate) and functional symbols, and we accept first-order terms as patterns in matching logic.

$$\begin{aligned} P ::= & x & (1) \\ & | P_1 \wedge P_2 \\ & | \neg P \\ & | \forall x. P \\ & | \sigma(P_1, \dots, P_n), \end{aligned}$$

where the universal quantifier ( $\forall x$ ) behaves as a binder with alpha-renaming always assumed.

For simplicity, we did not mention sorting in the grammar definition, and assume it should be clear to all readers. For example, in  $P_1 \wedge P_2$ , both patterns  $P_1$  and  $P_2$  should have the same sort, and that sort is the sort of  $P_1 \wedge P_2$ . The sort of  $\forall x. P$  is the sort of

$P$ , while the sort of variable  $x$  does not matter. To see why it is the case, consider the pattern  $\exists x.list(x, 1 \cdot 3 \cdot 5)$ , which is the set of all memory configurations that has a list  $(1, 3, 5)$  in it.

Propositional connectives are always assumed, including disjunction ( $\vee$ ), implication ( $\rightarrow$ ), and equivalence ( $\leftrightarrow$ ). Existential quantifier ( $\exists x$ ) is defined by universal quantifier ( $\forall x$ ) in the normal way. The bottom pattern ( $\perp_s$ ) and the top pattern ( $\top_s$ ) in sort  $s$  are given by  $x \wedge \neg x$  and  $\neg \perp_s$ , respectively, where  $x$  is a variable in sort  $s$ . It does not matter which variable we pick.

**Definition 1.** *The set of free variables in a pattern  $P$  is denoted as  $freevars(P)$ , defined recursively over the structure of  $P$  as usual. A pattern is said to be closed if  $freevars(P) = \emptyset$ . The universal (existential) generalization of  $P$ , denoted as  $\forall P$  ( $\exists P$ ), is defined as  $\forall x_1 \dots \forall x_n.P$  ( $\exists x_1 \dots \exists x_n.P$ ) where  $freevars(P) = \{x_1, \dots, x_n\}$ .*

## 1.1 Extended syntax

The formal language  $\mathcal{L}$  is often extended with *definedness* symbols. For  $s_1, s_2$  are two sorts, the definedness symbol  $\lfloor \_ \rfloor_{s_1}^{s_2} \in \Sigma_{s_1, s_2}$  is a unary symbol with one argument sort  $s_1$  and the result sort  $s_2$ . For a pattern  $P$  who has sort  $s_1$ , the pattern  $\lfloor \_ \rfloor_{s_1}^{s_2}(P)$  is often written as  $\lfloor P \rfloor_{s_1}^{s_2}$ , or simply  $\lfloor P \rfloor$ .

Definedness symbols carry specific intended semantics. For each definedness symbol  $\lfloor \_ \rfloor_{s_1}^{s_2}$ , we add the pattern  $\lfloor x \rfloor_{s_1}^{s_2}$  as an axiom to the deductive system, where  $x$  is a variable who has sort  $s_1$ . It does not matter which variable we pick.

With definedness symbols, we extend the formal language  $\mathcal{L}$  with

$$\begin{aligned} \lfloor P \rfloor_{s_1}^{s_2} &:= \neg \lfloor \neg P \rfloor_{s_1}^{s_2} \\ P_1 =_{s_1}^{s_2} P_2 &:= \lfloor P_1 \leftrightarrow P_2 \rfloor_{s_1}^{s_2} \\ P_1 \neq_{s_1}^{s_2} P_2 &:= \neg(P_1 =_{s_1}^{s_2} P_2) \\ P_1 \subseteq_{s_1}^{s_2} P_2 &:= \lfloor P_1 \rightarrow P_2 \rfloor_{s_1}^{s_2} \\ x \in_{s_1}^{s_2} P &:= x \subseteq_{s_1}^{s_2} P. \end{aligned}$$

**Remark 2.** *To prevent writing tangled subscripts and superscripts that indicate sorts of variables and patterns all the time, we omit them as much as possible, unless there is a chance of confusing things. A statement with sorting subscripts and superscripts omitted is treated as (possibly many) statements with the omitting sorting subscripts and superscripts completed in all possible well-formed ways.*

## 2 Deductive System

A deductive system is a recursive set of patterns as *axioms* and a finite set of *inference rules*. The deductive system of matching logic that we introduce in this section has been proved *sound* and *complete*.

## 2.1 The deductive system

Axioms are given by the following axiom schemata where  $P, Q, R$  are arbitrary patterns and  $x, y$  are arbitrary logic variables.

- (K1)  $P \rightarrow (Q \rightarrow P)$
- (K2)  $(P \rightarrow (Q \rightarrow R)) \rightarrow ((P \rightarrow Q) \rightarrow (P \rightarrow R))$
- (K3)  $(\neg P \rightarrow \neg Q) \rightarrow (Q \rightarrow P)$
- (K4)  $\forall x. P \rightarrow P[y/x]$
- (K5)  $\forall x. (P \rightarrow Q) \rightarrow (P \rightarrow \forall x. Q)$  if  $x$  does not occur free in  $P$
- (K6)  $P_1 = P_2 \rightarrow (Q[P_1/x] \rightarrow Q[P_2/x])$
- (Df)  $[x]$
- (M1)  $x \in y = (x = y)$
- (M2)  $x \in P \wedge Q = (x \in P) \wedge (x \in Q)$
- (M3)  $x \in \neg P = \neg(x \in P)$
- (M4)  $x \in \forall y. P = \forall y. x \in P$  where  $x$  is distinct from  $y$
- (M5)  $x \in \sigma(\dots, P_i, \dots) = \exists y. y \in P_i \wedge x \in \sigma(\dots, y, \dots)$  where  $y$  occurs free in the left hand side of the equation.

**Remark 3.** Substitution is denoted as  $Q[P/x]$ . Alpha-renaming is always assumed in order to avoid free variables capturing. Therefore, free variables in  $P$  are kept free after the substitution, i.e.,  $\text{freevars}(P) \subseteq \text{freevars}(Q[P/x])$ .

Inference rules include

- (Modus Ponens) From  $P$  and  $P \rightarrow Q$ , deduce  $Q$ .
- (Universal Generalization) From  $P$ , deduce  $\forall x. P$ .
- (Membership Introduction) From  $P$ , deduce  $\forall x. (x \in P)$ , where  $x$  does not occur free in  $P$ .
- (Membership Elimination) From  $\forall x. (x \in P)$ , deduce  $P$ , where  $x$  does not occur free in  $P$ .

**Theorem 4.** The proof system is sound and complete.

*Proof.* Refer to [RTA15]. □

## 2.2 Metatheorems of the deductive system

Writing formal proofs is never easy. Derivations are prone to be lengthy and boring. To ease such difficulty, we here in this section introduce a dozen of lemmas (i.e., metatheorems) of the deductive system. Metatheorems discover all kinds of properties of the deductive system, from the simplest “ $\vdash P = P$ ” to the complex deduction theorem and the framing rule.

**Proposition 5** (Tautology). *For any propositional tautology  $\mathcal{A}(p_1, \dots, p_n)$  where  $p_1, \dots, p_n$  are all propositional variables in  $\mathcal{A}$ , and for any patterns  $P_1, \dots, P_n$ ,*

$$\vdash \mathcal{A}(P_1, \dots, P_n).$$

*Proof.* No proof. □

**Corollary 6.**  $\vdash \top$ .

*Proof.* By definition,  $\top = \neg \perp = \neg(x \wedge \neg x)$ , where  $x$  is a matching logic variable who has the same sort with  $\top$ . Let proposition  $\mathcal{A} = \neg(p \wedge \neg p)$  with  $p$  is a propositional variable. Then  $\mathcal{A}$  is a propositional tautology. By Proposition 5,  $\top = \mathcal{A}[x/p]$  is derivable in the proof system, i.e.,  $\vdash \top$ . □

**Proposition 7.**  $\vdash P \rightarrow Q$  implies  $P \vdash Q$ .

*Proof.* The proof is a simple application of the Modus Ponens inference rule, as shown in the next derivation tree.

$$\frac{\frac{\cdot}{P \rightarrow Q} \quad \frac{\cdot}{P}}{Q} \text{ (MP)}$$

□

**Proposition 8** ( $\vee$ -Introduction).  $\vdash P$  implies  $\vdash P \vee Q$ .

*Proof.*

$$\frac{\frac{\cdot}{\vdash P} \quad \frac{\cdot}{\vdash P \rightarrow (\neg Q \rightarrow P)} \text{ (K1)}}{\frac{\vdash \neg Q \rightarrow P}{\vdash P \vee Q} \text{ (MP) (Sugar)}}$$

□

**Corollary 9** ( $\rightarrow$ -Introduction).  $\vdash P$  implies  $\vdash Q \rightarrow P$  and  $\vdash \neg P \rightarrow Q$ .

**Remark 10.** In general,  $\vdash P \vee Q$  does not implies  $\vdash P$  or  $\vdash Q$ . For example, we have shown that  $\vdash \top$ , and  $\top$  is, by definition, just sugar of  $\neg \perp = \neg(x \wedge \neg x) = \neg x \vee x$ . It is clearly wrong if we conclude  $\vdash \neg x$  or  $\vdash x$ . From a semantic point of view, it is easy to understand: the union of two sets is the total set does not imply that one of them is the total set.

**Proposition 11** ( $\wedge$ -Introduction and Elimination).  $\vdash P$  and  $\vdash Q$  iff  $\vdash P \wedge Q$ .

*Proof.* ( $\Rightarrow$ ).

$$\frac{\frac{\frac{\cdot}{\vdash P}}{\vdash Q} \quad \frac{\frac{\cdot}{\vdash Q} \quad \frac{\cdot}{\vdash Q \rightarrow P \rightarrow P \wedge Q}}{\vdash P \rightarrow P \wedge Q} \text{ (Taut)} \quad \text{(MP)}}{\vdash P \wedge Q} \text{ (MP)}$$

( $\Leftarrow$ ). Left as an exercise.  $\square$

Equalities plays an important role in matching logic. Axiom (K6) is very powerful even though it looks quite simple. It basically says that whenever one establishes that  $P = Q$ , then the two patterns are interchangeable everywhere in any patterns, as concluded in the next lemma.

**Lemma 12.** *If  $\vdash P_1 = P_2$  and  $\vdash Q[P_1/x]$ , then  $\vdash Q[P_2/x]$ .*

*Proof.*

$$\frac{\frac{\frac{\cdot}{\vdash P_1 = P_2}}{\vdash P_1 = P_2 \rightarrow (Q[P_1/x] \rightarrow Q[P_2/x])} \text{ (K6)} \quad \frac{\frac{\cdot}{\vdash Q[P_1/x]} \quad \frac{\cdot}{\vdash Q[P_2/x]}}{\vdash Q[P_2/x]} \text{ (MP)}}{\vdash Q[P_2/x]} \text{ (MP)}$$

$\square$

Remind that the equality “=” is not a built-in logic connective in matching logic. It is the syntactic sugar of  $\neg[\neg(P \leftrightarrow Q)]$ , where  $[\_]$  is the definedness symbol that we introduced before. One may wonder how to establish such equalities in the deduction system. Indeed, the proof system says little about how to derive an equality. Most of its axioms (except (K6)) and rules are not even about equalities. That is why the next proposition is quite useful in practice. It helps one to establish an equality pattern.

**Proposition 13.**  *$\vdash P \leftrightarrow Q$  iff  $\vdash P = Q$ .*

*Proof.* That the right hand side implies the left is easy, so we left the proof as an exercise to the readers. In the following, we only prove that the left implies the right. By definition,  $P = Q$  is the syntactic sugar of  $\neg[\neg(P \leftrightarrow Q)]$ , so we have the following derivation.

$$\frac{\frac{\frac{\cdot}{\vdash P \leftrightarrow Q}}{\vdash \forall y.(y \in P \leftrightarrow Q)} \text{ (\epsilon-Intro)}}{\vdash y \in P \leftrightarrow Q} \text{ (K4, MP)} \quad \frac{\vdash y \in P \leftrightarrow Q}{\vdash \neg(x \in [y]) \vee (y \in P \leftrightarrow Q)} \text{ (\vee-Intro)} \quad \frac{\vdash \neg(x \in [y]) \vee (y \in P \leftrightarrow Q)}{\vdash \forall y.(\neg(x \in [y]) \vee (y \in P \leftrightarrow Q))} \text{ (\forall y-Gen)} \quad \frac{\vdash \forall y.(\neg(x \in [y]) \vee (y \in P \leftrightarrow Q))}{\vdash \neg \exists y.(x \in [y] \wedge y \in \neg(P \leftrightarrow Q))} \text{ (Sugar, K3, M3)} \quad \frac{\vdash \neg \exists y.(x \in [y] \wedge y \in \neg(P \leftrightarrow Q))}{\vdash \neg(x \in [\neg(P \leftrightarrow Q)])} \text{ (K6, M5)} \quad \frac{\vdash \neg(x \in [\neg(P \leftrightarrow Q)])}{\vdash x \in \neg[\neg(P \leftrightarrow Q)]} \text{ (K6, M3)} \quad \frac{\vdash x \in \neg[\neg(P \leftrightarrow Q)]}{\vdash \forall x.(x \in \neg[\neg(P \leftrightarrow Q)])} \text{ (\forall x-Gen)} \quad \frac{\vdash \forall x.(x \in \neg[\neg(P \leftrightarrow Q)])}{\vdash \neg[\neg(P \leftrightarrow Q)]} \text{ (\epsilon-Intro)}$$

$\square$

**Remark 14.** We never say  $P = Q$  and  $P \leftrightarrow Q$  are logically equivalent. One will never derive  $\vdash (P = Q) = (P \leftrightarrow Q)$  for any patterns  $P$  and  $Q$  in the deductive system from a consistent set of axioms.

**Corollary 15.** The following propositions hold for any pattern  $P$ .

1.  $\vdash P \text{ iff } \vdash P = \top$ .
2.  $\vdash \neg P \text{ iff } \vdash P = \perp$ .
3.  $\vdash (P \wedge \top) = P$ .
4.  $\vdash (P \wedge \perp) = \perp$ .
5.  $\vdash (P \vee \top) = \top$ .
6.  $\vdash (P \vee \perp) = P$ .
7.  $\vdash \forall x. \top = \top$ .
8.  $\vdash \forall x. \perp = \perp$ .
9.  $\vdash \exists x. \top = \top$ .
10.  $\vdash \exists x. \perp = \perp$ .
11.  $\vdash (x \in \top) = \top$ .
12.  $\vdash (x \in \perp) = \perp$ .
13.  $\vdash P = P$ .

*Proof.* Left as exercises. Hint: use Proposition 13. □

Equalities are important, both semantically and syntactically. First recall the next proposition of the semantics of equalities.

**Proposition 16.** If  $\models P = Q$ , then in any model  $M$  and evaluation  $\rho$ ,  $\bar{\rho}(P) = \bar{\rho}(Q)$  in  $M$ .

Roughly speaking, if we establish  $\models P = Q$ , then it means that  $P$  and  $Q$  are interchangeable in any ways in any models. The same thing happen in a syntactic prospective, too, as we have seen in Proposition 12. But we can do more, as shown in the next proposition.

**Proposition 17.**  $\vdash P = Q$  implies  $\vdash \forall x. P = \forall x. Q$  and  $\vdash \exists x. P = \exists x. Q$ , where  $x$  is an arbitrary variable that may or may not be free in  $P$  or  $Q$ .

*Proof.* To be continued. □

**Proposition 18** (Functional Substitution).  $\vdash \exists y. (Q = y) \rightarrow (\forall x. P \rightarrow P[Q/x])$ , if  $y$  occurs free in  $Q$ .

*Proof.* To be continued. □

**Proposition 19.**  $\vdash x \in [y]$ .

*Proof.*

$$\begin{aligned} & \vdash x \in [y] \\ & \text{if } \vdash \forall x.(x \in [y]) & (K5, K6, \text{ and Modus Ponens}) \\ & \text{iff } \vdash [y]. \end{aligned}$$

□

**Proposition 20.**  $\vdash P \rightarrow [P]$ .

*Proof.*

$$\begin{aligned} & \vdash P \rightarrow [P] \\ & \text{iff } \vdash \forall x.(x \in P \rightarrow [P]) \\ & \text{if } \vdash x \in P \rightarrow [P] \\ & \text{iff } \vdash x \in P \rightarrow x \in [P] \\ & \text{iff } \vdash x \in P \rightarrow \exists y.(y \in P \wedge x \in [y]) \\ & \text{iff } \vdash x \in P \rightarrow \neg \forall y.(y \notin P \vee x \notin [y]) \\ & \text{iff } \vdash \forall y.(y \notin P \vee x \notin [y]) \rightarrow x \notin P \\ & \text{if } \vdash x \notin P \vee x \notin [x] \rightarrow x \notin P \\ & \text{iff } \vdash x \in P \rightarrow x \in P \wedge x \in [x] \\ & \text{iff } \vdash x \in P \rightarrow x \in [x] \\ & \text{if } \vdash x \in [x] \end{aligned}$$

**Remark** Similarly we can show  $\vdash [P] \rightarrow P$ .

□

**Proposition 21.**  $\vdash \forall x.(x \in P) = [P]$ , where  $x$  occurs free in  $P$ .

*Proof.* By Proposition 13 and 11, it suffices to show

$$\vdash \forall x.(x \in P) \rightarrow [P] \tag{2}$$

and

$$\vdash [P] \rightarrow \forall x.(x \in P). \tag{3}$$

To show (2),

$$\begin{aligned}
& \vdash \forall x.(x \in P) \rightarrow [P] \\
& \text{iff } \vdash \forall x.[x \wedge P] \rightarrow \neg[\neg P] \\
& \text{iff } \vdash [\neg P] \rightarrow \exists x.\neg[x \wedge P] \\
& \text{iff } \vdash \forall y.(y \in ([\neg P] \rightarrow \exists x.\neg[x \wedge P])) \\
& \text{if } \vdash y \in ([\neg P] \rightarrow \exists x.\neg[x \wedge P]) \\
& \text{iff } \vdash \exists z_1.(z_1 \notin P \wedge y \in [z_1]) \rightarrow \\
& \quad \exists x.\neg(\exists z_2.(z_2 = x \wedge z_2 \in P \wedge y \in [z_2])) \\
& \text{iff } \vdash \exists z_1.(z_1 \notin P \wedge \top) \rightarrow \quad (\text{Proposition 19, ??, and Corollary ??}) \\
& \quad \exists x.\neg(\exists z_2.(z_2 = x \wedge z_2 \in P \wedge \top)) \\
& \text{iff } \vdash \exists z_1.(z_1 \notin P) \rightarrow \exists x.\neg(\exists z_2.(z_2 = x \wedge z_2 \in P)) \\
& \text{iff } \vdash \forall x.(\exists z_2.(z_2 = x \wedge z_2 \in P)) \rightarrow \forall z_1.(z_1 \in P) \\
& \text{if } \vdash \forall z_1.(\forall x.(\exists z_2.(z_2 = x \wedge z_2 \in P)) \rightarrow (z_1 \in P)) \\
& \text{if } \vdash \forall x.(\exists z_2.(z_2 = x \wedge z_2 \in P)) \rightarrow (z_1 \in P).
\end{aligned}$$

Since  $\vdash \forall x.(\exists z_2.(z_2 = x \wedge z_2 \in P)) \rightarrow \exists z_2.(z_2 = z_1 \wedge z_2 \in P)$ , it suffices to show

$$\begin{aligned}
& \vdash \exists z_2.(z_2 = z_1 \wedge z_2 \in P) \rightarrow (z_1 \in P) \\
& \text{iff } \vdash z_1 \notin P \rightarrow \forall z_2.(z_2 \neq z_1 \vee z_2 \notin P) \\
& \text{if } \vdash \forall z_2.(z_1 \notin P \rightarrow z_2 \neq z_1 \vee z_2 \notin P) \\
& \text{if } \vdash z_1 \notin P \rightarrow z_2 \neq z_1 \vee z_2 \notin P \\
& \text{if } \vdash z_2 = z_1 \wedge z_2 \in P \rightarrow z_1 \in P.
\end{aligned}$$

And we proved (2).

Similarly, to show (3),

$$\begin{aligned}
& \vdash [P] \rightarrow \forall x.(x \in P) \\
& \text{iff } \vdash \exists x.\neg[x \wedge P] \rightarrow [\neg P] \\
& \text{iff } \vdash \forall y.(y \in \exists x.\neg[x \wedge P] \rightarrow [\neg P]) \\
& \text{if } \vdash y \in \exists x.\neg[x \wedge P] \rightarrow [\neg P] \\
& \text{iff } \vdash \exists x.\neg\exists z_2.(z_2 = x \wedge z_2 \in P) \rightarrow \exists z_1.(z_1 \notin P) \\
& \text{iff } \vdash \forall z_1.(z_1 \in P) \rightarrow \exists z_2.(z_2 = z_1 \wedge z_2 \in P) \\
& \text{iff } \vdash x \in P \rightarrow \exists z_2.(z_2 = x \wedge z_2 \in P).
\end{aligned}$$

We proved (3).

**Remark** If  $x$  occurs free in  $P$ , the result does not hold. For example, let  $P$  be  $upto(x)$  where  $upto(\cdot)$  is interpreted to  $upto(n) = \{0, 1, \dots, n\}$  on  $\mathbb{N}$ .  $\square$

**Remark** From Membership Introduction and Elimination inference rules and Proposition 21,  $\vdash P$  iff  $\vdash [P]$ .

**Proposition 22** (Classification Reasoning). *For any  $P$  and  $Q$ , from  $\vdash P \rightarrow Q$  and  $\vdash \neg P \rightarrow Q$  deduce  $\vdash Q$ .*

*Proof.* From  $\vdash \neg P \rightarrow Q$  deduce  $\vdash \neg Q \rightarrow P$ . Notice that  $\vdash P \rightarrow Q$ , so we have  $\vdash \neg Q \rightarrow Q$ , i.e.,  $\vdash \neg\neg Q \vee Q$  which concludes the proof.  $\square$

**Corollary 23.** *For any  $P_1, P_2$ , and  $Q$  are patterns with  $\vdash P_1 \vee P_2$ , from  $\vdash P_1 \rightarrow Q$  and  $\vdash P_2 \rightarrow Q$ , deduce  $\vdash Q$ .*

**Definition 24** (Predicate Pattern). *A pattern  $P$  is called a predicate pattern or a predicate if  $\vdash (P = \top) \vee (P = \perp)$ .*

**Remark** Predicate patterns are closed under all logic connectives.

**Remark** For any  $P$ ,  $\lceil P \rceil$  is a predicate pattern.

**Proposition 25.**  $\vdash (\lceil P \rceil = \perp) = (P = \perp)$  and  $\vdash (\lfloor P \rfloor = \top) = (P = \top)$ .

*Proof.* It is easy to prove one derivation from the other, so we only prove the first one. By Proposition 13, it suffices to prove

$$\vdash (\lceil P \rceil = \perp) \rightarrow (P = \perp) \quad (4)$$

and

$$\vdash (P = \perp) \rightarrow (\lceil P \rceil = \perp) \quad (5)$$

The proof of (5) is trivial and we left it as an exercise. We now prove (4) through the following backward reasoning.

$$\begin{aligned} & \vdash (\lceil P \rceil = \perp) \rightarrow (P = \perp) \\ \text{iff} \quad & \vdash \forall y. (y \in ((\lceil P \rceil = \perp) \rightarrow (P = \perp))) \\ \text{if} \quad & \vdash y \in ((\lceil P \rceil = \perp) \rightarrow (P = \perp)) \\ \text{iff} \quad & \vdash (y \in (\lceil P \rceil = \perp) \rightarrow (y \in (P = \perp))). \end{aligned} \quad (6)$$

While for any pattern  $Q$ ,

$$\begin{aligned} & \vdash y \in (Q = \perp) \\ \text{iff} \quad & \vdash y \in \neg[\neg(Q \leftrightarrow \perp)] \\ \text{iff} \quad & \vdash y \in \neg[Q] \\ \text{iff} \quad & \vdash \neg\exists z. (z \in Q \wedge y \in \lceil z \rceil) \\ \text{iff} \quad & \vdash \neg\exists z. (z \in Q) \end{aligned}$$

So we continue to prove (6) by showing

$$\begin{aligned}
& \vdash (y \in ([P] = \perp)) \rightarrow (y \in (P = \perp)) \\
\text{iff } & \vdash \neg \exists z. (z \in [P]) \rightarrow \neg \exists z. (z \in P) \\
\text{iff } & \vdash \exists z. (z \in P) \rightarrow \exists z. (z \in [P]) \\
\text{iff } & \vdash \exists z. (z \in P) \rightarrow \exists z. (\exists z_1. (z_1 \in P \wedge z \in [z_1])) \\
\text{iff } & \vdash \exists z. (z \in P) \rightarrow \exists z. \exists z_1. (z_1 \in P) \\
\text{iff } & \vdash \exists z_1. (z_1 \in P) \rightarrow \exists z. \exists z_1. (z_1 \in P).
\end{aligned}$$

And we finish the proof by noticing the fact that for any pattern  $Q$  and variable  $x$ ,

$$\vdash Q \rightarrow \exists x. Q.$$

□

**Proposition 26.** *For any predicate  $P$ ,  $\vdash (P \neq \top) = (P = \perp)$  and  $\vdash (P \neq \perp) = (P = \top)$ .*

*Proof.* We only prove the first derivation, by showing both

$$\vdash (P \neq \top) \rightarrow (P = \perp) \tag{7}$$

and

$$\vdash (P = \perp) \rightarrow (P \neq \top). \tag{8}$$

Proving (8) is trivial. We now prove (7), which is also trivial by transforming disjunction to implication. □

**Proposition 27.** *For any pattern  $Q$  and any predicate pattern  $P$ ,  $\vdash P \vee Q$  iff  $\vdash P \vee [Q]$ .*

*Proof.*  $(\Leftarrow)$  is obtained immediately by the remark of Proposition 20. We now prove  $(\Rightarrow)$ .

Because  $\vdash Q = \top \vee Q \neq \top$ , it suffices to show

$$\vdash Q = \top \rightarrow (P \vee [Q] = \top) \tag{9}$$

and

$$\vdash Q \neq \top \rightarrow (P \vee [Q] = \top) \tag{10}$$

by Corollary 23, and the fact that  $\vdash P \vee [Q] = \top$  and  $\vdash \top$  imply  $\vdash P \vee [Q]$ .

The proof of (9) is straightforward as follows.

$$\begin{aligned}
& \vdash Q = \top \rightarrow (P \vee [Q] = \top) \\
\text{if } & \vdash Q = \top \rightarrow (P \vee [\top] = \top) \\
\text{if } & \vdash Q = \top \rightarrow (\top = \top) \\
\text{if } & \vdash \top.
\end{aligned}$$

The proof of (10) needs more effort:

$$\begin{aligned}
& \vdash Q \neq \top \rightarrow (P \vee \lfloor Q \rfloor = \top) \\
\text{iff } & \vdash (Q = \top) \vee (P \vee \lfloor Q \rfloor = \top) \\
\text{iff } & \vdash (\lfloor Q \rfloor = \top) \vee (P \vee \lfloor Q \rfloor = \top) \\
\text{iff } & \vdash \lfloor Q \rfloor \neq \top \rightarrow (P \vee \lfloor Q \rfloor = \top) \\
\text{iff } & \vdash \lfloor Q \rfloor = \perp \rightarrow (P \vee \lfloor Q \rfloor = \top) \\
\text{if } & \vdash \lfloor Q \rfloor = \perp \rightarrow (P \vee \perp = \top) \\
\text{iff } & \vdash \lfloor Q \rfloor = \perp \rightarrow (P = \top) \\
\text{if } & \vdash Q = \top \vee P = \top.
\end{aligned}$$

Notice that  $P$  is a predicate pattern, so it suffices to show

$$\vdash P = \top \rightarrow (Q = \top \vee P = \top),$$

whose validity is obvious, and

$$\vdash P = \perp \rightarrow (Q = \top \vee P = \top),$$

which is proved by showing

$$\vdash P = \perp \rightarrow Q = \top. \quad (11)$$

Because  $\vdash P \vee Q$ , it suffices to show

$$\begin{aligned}
& \vdash P = \perp \rightarrow (P \vee Q) \rightarrow (Q = \top) \\
\text{if } & \vdash P = \perp \rightarrow (\perp \vee Q) \rightarrow (Q = \top) \\
\text{iff } & \vdash P = \perp \rightarrow Q \rightarrow (Q = \top) \\
\text{if } & \vdash Q \rightarrow (Q = \top) \\
\text{iff } & \vdash (Q \neq \top) \rightarrow \neg Q \\
\text{iff } & \vdash (\lfloor Q \rfloor = \perp) \rightarrow \neg Q.
\end{aligned}$$

Notice we have  $\vdash Q \rightarrow \lfloor Q \rfloor$ , which means  $\vdash \neg \lfloor Q \rfloor \rightarrow \neg Q$ , so it suffices to show

$$\begin{aligned}
& \vdash (\lfloor Q \rfloor = \perp) \rightarrow \neg \lfloor Q \rfloor \\
\text{iff } & \vdash (\lfloor Q \rfloor = \perp) \rightarrow \neg \perp \\
\text{iff } & \vdash (\lfloor Q \rfloor = \perp) \rightarrow \top \\
\text{iff } & \vdash \top.
\end{aligned}$$

And this concludes the proof.  $\square$

**Proposition 28** (Deduction Theorem). *If  $\Gamma \cup \{P\} \vdash Q$  and the derivation does not use  $\forall x$ -Generalization where  $x$  is free in  $P$ , then  $\Gamma \vdash \lfloor P \rfloor \rightarrow Q$ .*

*Proof.* The proof is by induction on  $n$ , the length of the derivation of  $Q$  from  $\Gamma \cup \{P\}$ .

Base step:  $n = 1$ , and  $Q$  is an axiom, or  $P$ , or a member of  $\Gamma$ . If  $Q$  is an axiom or a member of  $\Gamma$ , then  $\Gamma \vdash Q$  and as a result,  $\Gamma \vdash [P] \rightarrow Q$ . If  $Q$  is  $P$ , then  $\Gamma \vdash [P] \rightarrow Q$  by Proposition 20.

Induction step: Let  $n > 1$ . Suppose that if  $P'$  can be deduced from  $\Gamma \cup \{P\}$  without using  $\forall x$ -Generalization where  $x$  is free in  $P$ , in a derivation containing fewer than  $n$  steps, then  $\Gamma \vdash [P] \rightarrow P'$ .

Case 1:  $Q$  is an axiom, or  $P$ , or a member of  $\Gamma$ . Precisely as in the Base step, we show that  $\vdash [P] \rightarrow Q$ .

Case 2:  $Q$  follows from two previous patterns in the derivation by an application of Modus Ponens. These two patterns must have the forms  $Q_1$  and  $Q_1 \rightarrow Q$ , and each one can certainly be deduced from  $\Gamma \cup \{P\}$  by a derivation with fewer than  $n$  steps, by just omitting the subsequent members from the original derivation from  $\Gamma \cup \{P\} \vdash Q$ . So we have  $\Gamma \cup \{P\} \vdash Q_1$  and  $\Gamma \cup \{P\} \vdash Q_1 \rightarrow Q$ , and, applying the hypothesis of induction,  $\Gamma \vdash [P] \rightarrow Q_1$  and  $\Gamma \vdash [P] \rightarrow (Q_1 \rightarrow Q)$ . It follows immediately that  $\Gamma \vdash [P] \rightarrow Q$ .

Case 3:  $Q$  follows from a previous pattern in the derivation by an application of  $\forall x_i$ -Generalization where  $x_i$  does not occur free in  $P$ . So  $Q$  is  $\forall x_i. Q_1$ , say, and  $Q_1$  appears previously in the derivation. Thus  $\Gamma \cup \{P\} \vdash Q_1$ , and the derivation has fewer than  $n$  steps, so  $\Gamma \vdash [P] \rightarrow Q_1$ , since there is no application of Universal Generalization involving a free variable of  $P$ . Also  $x_i$  cannot occur free in  $P$ , as it is involved in an application of Universal Generalization in the deduction of  $Q$  from  $\Gamma \cup \{P\}$ . So we have a derivation of  $\Gamma \vdash [P] \rightarrow Q$  as follows.

$$\begin{aligned} & \Gamma \vdash [P] \rightarrow Q \\ \text{iff } & \Gamma \vdash [P] \rightarrow \forall x_i. Q_1 \\ \text{if } & \Gamma \vdash \forall x_i. ([P] \rightarrow Q_1) \\ \text{if } & \Gamma \vdash [P] \rightarrow Q_1. \end{aligned}$$

So  $\Gamma \vdash [P] \rightarrow Q$  as required.

Case 4:  $Q$  follows from a previous pattern in the derivation by an application of Membership Introduction. So  $Q$  is  $\forall x_i. (x_i \in Q_1)$  with  $x_i$  is free in  $Q_1$ , say, and  $Q_1$  appears previously in the derivation. Thus  $\Gamma \cup \{P\} \vdash Q_1$ , and the derivation has fewer than  $n$  steps, so  $\Gamma \vdash [P] \rightarrow Q_1$ , since there is no application of Universal Generalization involving a free variable of  $P$ . So we have a derivation of  $\Gamma \vdash [P] \rightarrow Q$  as follows.

$$\begin{aligned} & \Gamma \vdash [P] \rightarrow Q \\ \text{iff } & \Gamma \vdash [P] \rightarrow \forall x_i. (x_i \in Q_1) \\ \text{iff } & \Gamma \vdash [P] \rightarrow [Q_1], \end{aligned}$$

which follows by the hypothesis of induction  $\Gamma \vdash [P] \rightarrow Q_1$  and the fact that  $\Gamma \vdash Q_1 \rightarrow [Q_1]$  (by the Remark in Proposition 20).

Case 5:  $Q$  follows from a previous pattern in the derivation by an application of Membership Elimination. The previous pattern must have the form  $\forall x_i. (x_i \in Q)$ , and can be deduced from  $\Gamma \cup \{P\}$  by a derivation with fewer than  $n$  steps, by just omitting

the subsequent members from the original derivation from  $\Gamma \cup \{P\} \vdash Q$ . So we have  $\Gamma \cup \{P\} \vdash \forall x_i.(x_i \in Q)$ , and, applying the hypothesis of induction,  $\Gamma \vdash [P] \rightarrow \forall x_i.(x_i \in Q)$ . So we have a derivation of  $\Gamma \vdash [P] \rightarrow Q$  as follows.

$$\begin{aligned}
& \Gamma \vdash [P] \rightarrow Q \\
\text{iff } & \Gamma \vdash \neg[P] \vee Q \\
\text{iff } & \Gamma \vdash \neg[P] \vee [Q] & \text{(Proposition 27)} \\
\text{iff } & \Gamma \vdash \neg[P] \vee \forall x_i.(x_i \in Q) \\
\text{iff } & \Gamma \vdash [P] \rightarrow \forall x_i.(x_i \in Q),
\end{aligned}$$

which is the hypothesis of induction. And this concludes our inductive proof.  $\square$

**Corollary 29** (Closed-form Deduction Theorem). *If  $P$  is closed,  $\Gamma \cup \{P\} \vdash Q$  implies  $\Gamma \vdash [P] \rightarrow Q$ .*

**Theorem 30** (Frame Rule). *Let  $\sigma \in \Sigma$  be a symbol in the signature. From  $P_1 \rightarrow P_2$ , deduce  $\sigma(P_1) \rightarrow \sigma(P_2)$ . In its most general form,  $P_1 \rightarrow P_2$  deduces  $\sigma(Q_1, \dots, P_1, \dots, Q_n) \rightarrow \sigma(Q_1, \dots, P_2, \dots, Q_n)$ .*

*Proof.* we write  $\sigma(Q_1, \dots, P_i, \dots, Q_n)$  as  $\sigma(P_i, \vec{Q})$  for short, for any  $i \in \{1, 2\}$ .

$$\begin{aligned}
& \vdash \sigma(P_1, \vec{Q}) \rightarrow \sigma(P_2, \vec{Q}) \\
\text{iff } & \vdash y \in (\sigma(P_1, \vec{Q}) \rightarrow \sigma(P_2, \vec{Q})) \\
\text{iff } & \vdash (y \in \sigma(P_1, \vec{Q})) \rightarrow (y \in \sigma(P_2, \vec{Q})) \\
\text{iff } & \vdash \exists z_1. \exists \vec{z}. (z_1 \in P_1 \wedge \vec{z} \in \vec{Q} \wedge y \in \sigma(z_1, \vec{z})) \\
& \rightarrow \exists z_2. \exists \vec{z}. (z_2 \in P_2 \wedge \vec{z} \in \vec{Q} \wedge y \in \sigma(z_2, \vec{z})) \\
\text{iff } & \vdash \exists z_1. \exists \vec{z}. (z_1 \in P_1 \wedge \vec{z} \in \vec{Q} \wedge y \in \sigma(z_1, \vec{z})) \\
& \rightarrow z_1 \in P_2 \wedge \vec{z} \in \vec{Q} \wedge y \in \sigma(z_1, \vec{z})) \\
\text{iff } & \vdash \exists z_1. \exists \vec{z}. (z_1 \in P_1 \rightarrow z_1 \in P_2) \\
\text{if } & \vdash \exists z_1. (z_1 \in P_1 \rightarrow z_1 \in P_2) \\
\text{if } & \vdash P_1 \rightarrow P_2.
\end{aligned}$$

$\square$

**Corollary 31** (Frame Rule).  $\vdash [P \rightarrow Q] \rightarrow (\sigma(P) \rightarrow \sigma(Q))$

## 2.3 The ML2FOL translation

Given a matching logic signature  $(S, \Sigma)$  where  $\Sigma = \Sigma_{func} \cup \Sigma_{partial} \cup \Sigma_{else}$  contains some functional symbols, some partial symbols and some other symbols. Define two formula transformations  $\text{fol}$  and  $\text{fol}_2$  as follows.

**Input:** a matching logic pattern  $P$

**Output:** a first order formula

generate a fresh variable  $r$ ;

return  $\forall r. \text{fol}_2(P, r)$ ;

**Algorithm 1:** The fol transformation

**Input:** a matching logic pattern  $P$  and a variable  $r$

**Output:** a first order formula

Match  $P$  with

**Algorithm 2:** The  $\text{fol}_2$  transformation

### 3 Applications

#### 3.1 Axiomatizing transition systems

**Definition 32.** A transition system  $T = (Cfg, \tau)$  has a (finite or infinite) set  $Cfg$  of configurations and a transition (partial) function  $\tau : Cfg \rightarrow Cfg$ . The set of direct successors and direct predecessors of a configuration  $c \in Cfg$  are denoted as  $\tau(c)$  and  $\tau^{-1}(c)$  respectively. A configuration is terminal if it has no successor.

**Remark 33.** There is a dual way to define a transition system  $T = (Cfg, \tau)$ . Instead of specifying the transition function  $\tau$ , we can define the reverse transition function or the predecessor function  $\tau^{-1}$ . This fact is witnessed by the next Galois connection

$$\begin{aligned}\tau(c) &= \{d \in Cfg \mid c \in \tau^{-1}(d)\}, \\ \tau^{-1}(d) &= \{c \in Cfg \mid d \in \tau(c)\}.\end{aligned}$$

Fix a signature  $(S, \Sigma)$  where  $S = \{Cfg\}$  has only one sort and  $\Sigma = \{\bullet\}$  has a unary symbol. Such a signature is called *the signature of transition systems*, as illustrated by the obvious interpretation that takes the sort  $Cfg$  to the carrier set  $Cfg$  of a transition system  $(Cfg, \tau)$  and interprets the symbol  $\bullet$  as the predecessor function  $\tau^{-1}$ .

**Definition 34.** Given  $(S, \Sigma)$  the a signature of transition systems. Introduce predicate patterns  $P \Rightarrow_1^? Q$ , read as “ $P$  rewrites (?) to  $Q$ ”, as the syntactic sugar of  $P \subseteq \bullet Q$ . A transition system theory is a theory whose signature is the signature of transition systems, and whose axioms are all of the form  $P \Rightarrow_1^? Q$ .

The unary symbol  $\bullet$  is known as the “strong-next” temporal connective in temporal logics. Its dual version, the so-called “weak-next” connective  $\circ$  is defined as  $\neg \bullet \neg$  in the usual way.

**Example 35.** Give  $T$  is a theory of transition systems, then  $T \vdash P \subseteq \circ \perp$  implies that in any transition system  $T$  who is a model of the theory,  $P$  is a set of terminal configurations. For the same reason,  $T \vdash P \subseteq \bullet \top$  implies that  $P$  is a set of nonterminal configurations.

**Example 36.** Let  $T$  be a transition system whose configuration set contains all natural numbers plus one single special configuration  $c_{rand}$ . Natural numbers are all terminal

configurations. Intuitively,  $c_{rand}$  is the special configuration that will randomly rewrite to some natural number in a step.

Suppose one has that intuition of randomness in mind, and starts to write specification for that intuition. The followings are possible ones that he might write (we abbreviate  $\Rightarrow_1^\forall$  as  $\Rightarrow$ ).

1.  $c_{rand} \Rightarrow \top$ .<sup>1</sup>
2.  $\forall x.(c_{rand} \Rightarrow x)$ .
3.  $c_{rand} \subseteq \forall x. \bullet x$ .

Before we study the subtle difference among these specifications, let us list some patterns that are logically equivalent to one of the above, which will cover most cases that any reader might think of. Patterns that are equivalent to the first case include  $c_{rand} \Rightarrow \exists x.x$ ,  $\exists x.(c_{rand} \Rightarrow x)$ , and  $c_{rand} \subseteq \exists x. \bullet x$ . Patterns that are equivalent of the second are  $c_{rand} \Rightarrow \forall x.x$ , or  $c_{rand} \Rightarrow \perp$ .

Obviously, the second case makes no sense. In fact, it is a falsity, because  $c_{rand}$  will never be a subset of  $\bullet \perp = \perp$ , the empty set. The first case is simply saying that  $c_{rand}$  is nonterminating. This might seem counterintuitive, but it does capture some kind of randomness here: it allows any models in which  $c_{rand}$  rewrites to something. Among those models, there exists the standard model where  $c_{rand}$  rewrites to possibly any of the natural numbers, but there also have models where  $c_{rand}$  only rewrite to some values but not others. It even allows models that rewrite  $c_{rand}$  to a fixed single value all the time. As a comparison, the third case precisely captures the standard model where  $c_{rand}$  is the predecessor of all natural numbers.

To conclude, the third specification is the one that fits the best with the requirement of having some random objects that can potentially become any possible objects, while the first specification is the one that allows any possible implementation of some non-deterministic objects. A typical example for that is the scheduler in a multithreaded program. The second specification is simply a mistake and should never be written.

**Problem** To define reachability logic, one needs to define  $P \Rightarrow_*^\forall Q$ , the so-called *all-path reachability predicate*, which is basically the transitive closure of  $\Rightarrow_1^\forall$ . However, it is known that one cannot define transitive closures in first-order logic. (One can do so in second-order logic, though.)

### 3.2 Symbolic execution

Different from normal concrete execution, symbolic execution method runs programs in a symbolic way, aiming for a better state-space converge rate. In the literatures of rewriting theory, symbolic execution is often called narrowing, whose main idea is to define a sequence of (symbolic) rewriting steps such that *any* concrete rewriting step can be seen as a specific way to *instantiate* the symbolic rewriting steps.

<sup>1</sup>For the rewriting patterns below, we assume the right hand sides are patterns of the sort *Nat*, regarded as a subsort of *Cfg*, although matching logic is truly not a order-sorted logic. This is for the sake of the simplicity of the example. Otherwise one may fall into unnecessary details that prevent him seeing the big picture.

**Definition 37.** A theory of symbolic execution is a theory of transition system whose axioms are all of the form  $P(\vec{x}, \vec{z}) \Rightarrow_1^V Q(\vec{x}, \vec{y})$  where

### 3.3 Context

Fix a signature  $(S, \Sigma)$ . For each sort  $s \in S$ , introduce an infinite number of *hole* variables, written as  $\square_1, \square_2, \dots$ . Think of hole variables as normal matching logic variables, but lie in a disjoint namespace. Extend the grammar by adding the following.

$$\begin{aligned} P ::= & \dots \\ & | \square \\ & | \gamma \square. P \\ & | P[P']. \end{aligned}$$

The sort of  $\gamma \square. P$  is the sort of  $P$ . The sort of  $P[P']$  is the sort of  $P$ , too. Think of  $\gamma \square$  as a binder. Alpha-renaming is always assumed. Patterns of the form  $\gamma \square. P$  are often called *contexts*, denoted by  $C, C_0, C_1, \dots$ . The pattern  $P[P']$  is often called an *application*. The  $[-]$  operator is left associative.

**Definition 38.** The context  $\gamma \square. \square$  is called the *identity context*, denoted as  $I$ . Identity context has the axiom schema  $I[P] = P$  where  $P$  is any pattern.

**Example 39.**  $I[I] = I$ .

**Example 40.** Consider a signature  $(S, \Sigma)$  of a simple imperative programming language, with  $S = \{BExp, Pgm\}$ , and  $\Sigma = \{skip, ite, seq, true, false\}$ . Add axiom schemata

$$ite(C_1[B], P, Q) = (\gamma \square. ite(C_1[\square], P, Q))[B]$$

and

$$seq(C_2[P], Q) = (\gamma \square. seq(C_2[\square], Q))[P],$$

where  $P, Q$  are Pgm patterns,  $B$  is a BExp pattern,  $C_1$  is a BExp context, and  $C_2$  is a Pgm context.

Suppose we have the rewrite rules (schemata):

- $C[ite(true, P, Q)] \Rightarrow C[P]$ ,
- $C[ite(false, P, Q)] \Rightarrow C[Q]$ ,
- $C[seq(skip, Q)] \Rightarrow C[Q]$ .

Example (a). Rewrite  $seq(skip, skip)$ .

$$\begin{aligned} seq(skip, skip) &= I[seq(skip, skip)] \\ &\Rightarrow I[skip] \\ &= skip. \end{aligned}$$

*Example (b). Rewrite  $\text{ite}(\text{true}, P, Q); R$ .*

$$\begin{aligned}
\text{seq}(\text{ite}(\text{true}, P, Q), R) &= \text{seq}(\llbracket \text{ite}(\text{true}, P, Q) \rrbracket, R) \\
&= (\gamma \square. \text{seq}(\llbracket \square \rrbracket, R))[\text{ite}(\text{true}, P, Q)] \\
&\Rightarrow (\gamma \square. \text{seq}(\llbracket \square \rrbracket, R))[P] \\
&= \text{seq}(\llbracket P \rrbracket, R) \\
&= \text{seq}(P, R).
\end{aligned}$$

**Definition 41.** Let  $\sigma \in \Sigma_{s_1 \dots s_n, s}$  is an  $n$ -arity symbol. We say  $\sigma$  is active on its  $i$ th argument ( $1 \leq i \leq n$ ), if  $\sigma(P_1, \dots, C[P_i], \dots, P_n) = (\gamma \square. \sigma(P_1, \dots, C[\square], \dots, P_n))[P_i]$ . Orienting the equation from the left to the right is often called *heating*, while orienting from the right to the left is called *cooling*.

**Example 42.** Suppose  $f$  and  $g$  are binary symbols who are active on their first argument. Suppose  $a, b$  are constants, and  $x$  is a variable. Let  $\square_1$  and  $\square_2$  be two hole variables. Define two contexts  $C_1 = \gamma \square_1. f(\square_1, a)$  and  $C_2 = \gamma \square_2. g(\square_2, b)$ .

Because  $f$  is active on the first argument,

$$\begin{aligned}
C_1[\varphi] &= (\gamma \square_1. f(\square_1, a))[\varphi] \\
&= (\gamma \square_1. f(\llbracket \square_1 \rrbracket, a))[\varphi] \\
&= f(\llbracket \varphi \rrbracket, a) \\
&= f(\varphi, a), \text{ for any pattern } \varphi.
\end{aligned}$$

And for the same reason,  $C_2[\varphi] = g(\varphi, b)$ . Then we have

$$\begin{aligned}
C_1[C_2[x]] &= C_1[f(x, a)] \\
&= g(f(x, a), b).
\end{aligned}$$

On the other hand,

$$\begin{aligned}
g(f(x, a), b) &= g(C_1[x], b) \\
&= (\gamma \square. g(C_1[\square], b))[x] \\
&= (\gamma \square. g(f(\square, a), b))[x].
\end{aligned}$$

Therefore, the context  $\gamma \square. g(f(\square, a), b)$  is often called the composition of  $C_1$  and  $C_2$ , denoted as  $C_1 \circ C_2$ .

**Example 43.** Suppose  $f$  is a binary symbol with all its two arguments active. Suppose  $C_1$  and  $C_2$  are two contexts and  $a, b$  are constants. Then easily we get

$$\begin{aligned}
f(C_1[a], C_2[b]) &= (\gamma \square_2. f(C_1[a], C_2[\square_2]))[b] \\
&= (\gamma \square_2. ((\gamma \square_1. f(C_1[\square_1], C_2[\square_2]))[a]))[b].
\end{aligned}$$

What happens above is similar to currying a function that takes two arguments. It says that there exists a context  $C_a$ , related with  $C_1, C_2, f$  and  $a$  of course, such that  $C_a[b]$  returns  $f(C_1[a], C_2[b])$ . The context  $C_a$  has a binding hole  $\square_2$ , and a body that itself is another context  $C'_a$  applied to  $a$ . In other words, there exists  $C_a$  and  $C'_a$  such that

- $f(C_1[a], C_2[b]) = C_a[b]$ ,
- $C_a = \gamma_{\square_2}.(C'_a[a])$ ,
- $C'_a = \gamma_{\square_1}.f(C_1[\square_1], C_2[\square_2])$ .

*A natural question is whether there is a context  $C$  such that  $C[a][b] = f(C_1[a], C_2[b])$ .*
